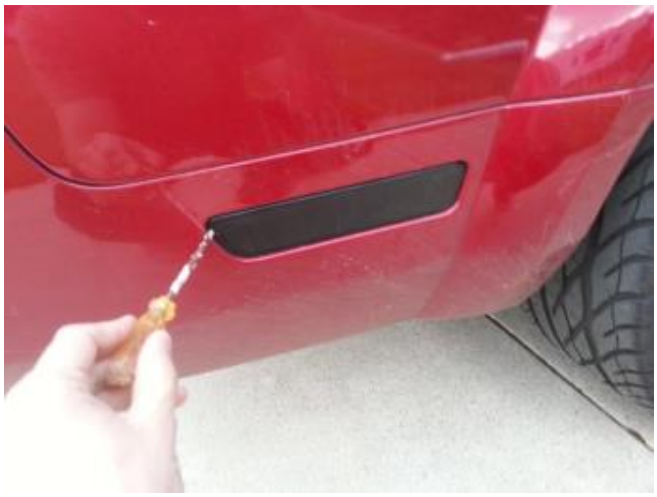
Rear Bumper Lenses (05-09 All)

Tools Needed:

- Flat Tip Screwdriver
- Light Bulbs #168 (*not required but a good time to check if the old bulbs have burned out*)

Step 1: Using your flat tip screwdriver, carefully pry the rear end side of the light from its mounting place.



Step 2: Slide the light towards the rear end of the car to completely remove it from its place.

Step 3: While holding onto the light, rotate the bulb until the tabs align with the holes and it can be pulled out from the light. *(Good time to check and see if the bulb has burned out)*

Step 4: Grab the new light and align the tabs on the bulb with the tabs on the new light. Slide the bulb in and rotate slightly to lock into place.

Step 5: Insert the tab on the rear end side of the light into the hole and then push the front end of the light back into its hole (*will take some pressure to get the tab into the hole and will click when it is properly in the hole*)

Step 6: Repeat steps 1-5 for the light on the opposite side.

Step 7: Turn on the car's headlights and check to verify that both new lights light up.

Before and After:

Side note: If you change the bulbs, it is recommended that you use Bulb Grease inside the fitting to prolong the life of the bulbs
