FORD RACING DIFFERENTIAL COVER 8.8 IRS

Tools Needed:

- Socket set, metric and standard
- Sledge hammer
- Puller device, pitman puller
- Jack
- Jack stands

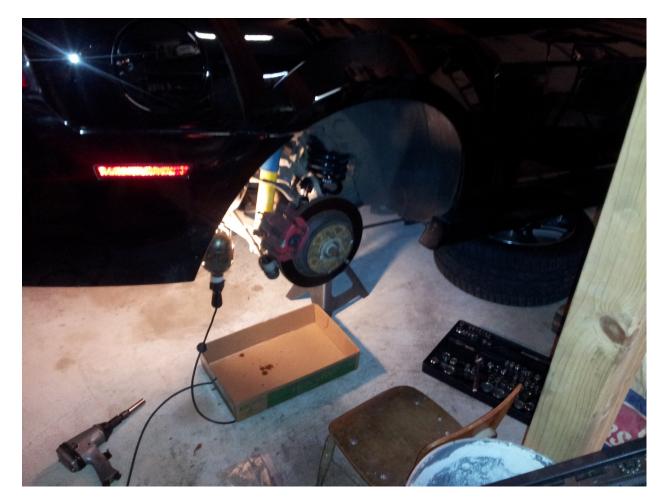

- Flat head screw drivers
- Torque wrench, capable of 8 ft/lbs and 250 ft/lbs
- Extra set of hands
- Differential fluid (75w-140 1.5-2 quarts)

Installation Instructions:

Place the car is your workspace, put the car in gear with the parking brake on.

- 1. Place the car on jack stands on all four corners; place the rear end as high up as you can.
- 2. Remove the rear tires, 21mm deep socket.
- 3. Remove mid pipe and cat back; 15mm deep socket.
- 4. Removing the cat back involves taking the hangers out of the rubber holding pieces, should be three of them. Use wd-40 to ease removal.

- 5. Remove both brake caliper bolts, 12mm. On both sides of the car.
- 6. Remove brake caliper on both side of the car.
- 7. Remove brake caliper bracket bolts, 15mm. On both side of the car.

- 8. Remove tire rod cotter pin using a pair of needle nose pliers.
- 9. Remove tire rod nut 15mm.
- 10. Remove tire rod using a puller device.
- 11. Remove lower control arm from wheel hub by removing the nut, 15mm.

- 12. Remove wheel hub center nut, 36mm deep socket. Very hard to get off.
- 13. Sledge hammer or puller device will be needed to hit the center stud to remove the hub assembly

- 14. Once both sides are removed, use a crow bar or big flat head screwdriver to pop out the half-shaft from the differential *USE A PAINT MARKER AND MARK THE OREINTATION OF THE HALF SHAFT*.
- 15. Then pull the half shaft out far enough to rest on the lower control arm.
- 16. Next you will need to remove the drive shaft. *MARK WITH A PAINT MARKER AT TWO DIFFERENT SPOTS* from the drive shaft on to the pinion.
- 17. Remove all four bolts holding the drive shaft to the pinion.
- 18. Once the bolts are removed push the drive shaft up and tie it in place with a piece of string or zip ties.
- 19. Next remove the sensors from both sides of the differential. One on each side.
- 20. Next loosen the differential rear isolator nuts, leave in place for now but loosen.
- 21. Loosen pinion cross member brace where it is connected to the sub frame. Leave brace in place.
- 22. Now bring the jack under the car to support the weight of the differential.

- 23. Now remove the two bolts on the pinion cross member that are connected to the differential, after this the differential should drop out.
- 24. Make sure you remove the rear bolts that we already loosened, and take the pinion cross member out now.
- 25. Once the differential is removed and lowered from the car place it on a work bench or clean surface.
- 26. Remove the drain plug and drain fluids into an oil pan.
- 27. Remove the differential pressure relief valve hose (save it).
- 28. Remove all 10 differential housing bolts.

- 29. Stock cover should fall off now.
- 30. Get a razor blade and a flat head screw driver and scrape away all the old gasket.
- 31. Get some sand paper and parts cleaner and scrape way any impurities, you need a clean surface.
- 32. Once the surface is clean and all excess fluid is drained get the grey rtv.
- 33. Apply the grey rtv around every single bolt area to make a very healthy gasket, use allot but make sure it is even. Apply the same on the ford racing differential cover.
- 34. Once both areas have been covered place the cover on the housing and place all ten bolts hand tight into the holes.
- 35. After ten minutes has passed torque down to 25ft/lbs.

- 36. Let differential sit for 24hrs before reinstalling
- 37. *EXTRA* since the fuel filter is such a pain to replace, replace now since there is so much room to get to it now
- 38. Follow all the steps in reverse in order to reinstall the diff housing
- 39. Torque specs need:
 - a. ABS bracket-to-lower arm = 17 ft-lbs
 - b. ABS bolt-to-diff = 5 ft-lbs
 - c. Brake banjo bolt = 30 ft-lbs
 - d. Brake caliper anchor bolts = 76 ft-lbs
 - e. Brake caliper bolt = 25 ft-lbs
 - f. Brake line-to-rear brake caliper bolt = 30 ft-lbs
 - g. Diff cover = 25 ft-lbs
 - Diff pinion nose crossmember-to-diff = 52 ft-lbs
 - i. Diff pinion nose crossmember-tosubframe = 184 ft-lbs
 - j. Diff rear insulator-to-axle housing bolts= 76 ft-lbs
 - k. Driveshaft to pinion flange = 83 ft-lbs (Blue Loctite)
 - I. Hub nut = 250 ft-lbs
 - m. Lower arm and bushing-to-subframe bolts = 184 ft-lbs
 - n. Lower arm and bushing-to-knuckle nut= 85 ft-lbs
 - Parking brake cable bracket-to-lower arm bushing bolt = 11 ft-lbs

- p. Rear brake disc dust sheild-to-knuckle bolts = 89 in-lbs
- q. Stabilizer bar bracket bolt = 41 ft-lbs
- r. Stabilizer bar link nuts = 35 ft-lbs
- s. Subframe-to-body bolts = 76 ft-lbs (14mm bolts = 131 ft-lbs; 9/16" bolt = 145 ft-lbs)
- t. Subframe-to-rear bracket bolts = 76 ftlbs
- u. Subframe rear bracket-to-body bolts = 59 ft-lbs
- v. Shock-to-lower arm and bushing bolts = 98 ft-lbs
- w. Shock-to-body nuts = 30 ft-lbs
- x. Toe link-to-subframe nut = 35 ft-lbs
- y. Toe link-to-knuckle nut = 35 ft-lbs
- Upper arm and bushing-to-subframe nuts = 66 ft-lbs

AA. Upper arm bushing-to-knuckle nut = 66 ft-lbs

BB. Wheel lugs = 95 ft-lbs

Before reinstalling the wheels and catback fill from the middle hole on the cover with 75w-140 royal purple differential fluid. 1.5-2 quarts is needed

Installation Instructions provided by AmericanMuscle customer Marc Missera 11.30.12
